

Meet the Romney sheep

- working to Regenerate the Land

These Romney sheep are more than just winter visitors – they play a vital role in restoring the land at Bore Place.

As part of an organic, rotational grazing system, they're moved regularly to allow pastures to rest and regrow. This supports diverse plant life, stimulates growth, and builds rich, healthy soil.

Their natural behaviour helps too – manure enriches the ground, hooves aerate the soil, and managed grazing protects fields from erosion. Healthy pastures also store carbon, supporting climate resilience.

These hardy sheep thrive on grass alone, fitting perfectly into Bore Place's sustainable farming system and helping create a more resilient landscape for the future.
